## Integrated Water, Land, and Resource Management System

### Water. Land. Natural Resources.

The droughts of recent years in the West have had dramatic effects on agricultural and human needs for the preservation of water resources. Clean water and the management of land resources are vital to the health and welfare of people and regional economies. There are also cultural, spiritual, and economic significance associated to these critical resources, and they are deserving of proper use, management, and protection. Further, with the threat of bio-terrorism, proper accountability of water sources and their protection is needed.

The ResourceVue solution provides an effective management platform to monitor the identification and use of water sources and related natural resources, so that the objectives for cultural, domestic, agricultural, stock, and other uses are adequately achieved.

ResourceVue provides an integrated approach for optimizing visibility of information and minimizing the time spent on managing water and land related data. Information tracked includes: surface and ground water sources with their related geospatial coordinates, points of diversion and related equipment, well metering, gauging sites, water-related permit applications and licenses, allotments of land with their geospatial coordinates, and other management data.

The web and database technology on which ResourceVue is designed allows for easy, controlled data exchange to partners or government agencies, like BLM, BIA, EPA, HHS, etc. Further, integration with GIS and geospatial data facilitates image management with tracking data attributes. Email alerting and business process management tools are also included off-the-shelf to manage virtual collaboration among people and organizations for permit approvals, action item tracking, meeting management, calendars, and custom reporting.

### Benefits

- ▶ Save time tracking water sources and permits
- ▶ Centralize land allotment tracking
- ▶ Enforce water code compliance
- ▶ Facilitate government reporting
- ▶ Centrally manage GIS images with data
- ▶ Improve visibility of water-related revenue
- ▶ Integrate water permit compliance with land leases

### Productivity Features Include

- ▶ Ground and water source identification
- ▶ Inter-relationships of water source tracking
- ▶ Water and well permit generation and approvals
- ▶ Well identification and inspections
- ▶ GIS image vault
- ▶ Points of diversion tracking
- ▶ Gauge site data integration
- ▶ Equipment tracking
- ▶ Land ownership tracking
- ▶ Land lease tracking
- ▶ Water and land inter-relationship tracking
- ▶ Crop and yield data tracking
- ▶ Custom module creation tools
